

## Course Web Development

Hello, my name is Rodrigo Moreno. I'm 28 years old and a computer engineer from Mexico City, where I was born and raised. During my childhood, I lived with my mother and sister, who still reside in Mexico. My primary and secondary education was nearby to my mothers work workplace, allowing me to be near my family. UNAM is where my academic path finally took me. There, I graduated from high school, then later got my bachelor's degree in Computer Engineering, where I developed a solid basis in systems design, algorithms, and software development.

I decided to concentrate on video game development, studying game engines, real-time programming, and user experience design. This experience eventually pointed me toward the mobile apps industry, where I now create and develop apps for the Android platform.

I expect to build a solid basis in full-stack web development from this course while also broadening my general programming knowledge. I want to acquire the practical knowledge and technical abilities required to create whole web applications from front-end to back-end. Beyond only gaining ideas, I want to acquire the tools and best practices that will enable me to be a qualified and competitive developer in the employment market. Ultimately, I see this course as a stepping stone to advance my career and secure better professional opportunities in the tech industry.

Well, I understand that the course, being the first week, was going to start slow, but I know that it is a way to structure the basic knowledge and also to begin taking into account that we are just starting, so I have felt good, and the classes have flowed normally.

I would like to be able to find a place where I can test the acquired knowledge, and to be able to improve my personal and professional development in the field of web development.
